

SSA Global - EXE Technologies

Business Need

- Warehouse Management Software company wanted to integrate BI into their core package for their customers. Key features needed included embedded standard reports, ad-hoc reporting, and analytics.

Solution

- LPA worked with the client's development team to gain basic understanding of the database and with their product management and sales to understand customer requirements for reporting and KPIs.
- LPA designed and built a solution that the customers could use as a template for all reporting and analytics. It consisted of a core catalog, a set of focused reports, and a set of analytic models and cubes.
- LPA created all the installation documentation, system requirements and user guides and also worked with the deployment team to configure the install-shield requirements and directory structures.

Business Need

- EXE/SSA had a user conference fast approaching. They had promised their customers a new way to do data analysis over the web... but had nothing to show!

Solution

- Within a week, LPA constructed a set of PowerPlay cubes and views based on the marketing requirements.
- All cubes were placed on the company demo server and the portal theme was customized to the company look and feel.
- During the same period, LPA worked with the client's sales department to assemble sell sheets and pricing strategies.
- It was the highlight of the conference!
